**29. Write a function in Dart named add that takes two numbers as arguments and returns their sum.**

**Program and Output Screenshot:**

## Dart Programming

The screenshot shows an IDE with a dark theme. The top part displays Dart code with line numbers 400 to 410. The code defines a `main` function that calls an `add` function. The `add` function takes two `double` arguments and returns their sum. Below the code editor, there is a tabbed interface with 'OUTPUT' selected. The output shows the program running successfully, printing the sum of 5.0 and 3.0 as 8.0.

```
Run | Debug
400 void main() {
401     double num1 = 5;
402     double num2 = 3;
403     double sum = add(num1, num2);
404     print("Sum of $num1 and $num2 is: $sum");
405 }
406
407 double add(double num1, double num2) {

**51. What is the purpose of the ? operator in Dart null safety?****Program and Output Screenshot:**

In Dart null safety, the `?` operator is used in several contexts to work with potentially nullable types. Its purpose is to indicate that a variable or expression can be null, and it allows for safe navigation and null-aware operations.

## Dart Programming

Here are the main uses of the `?` operator in Dart null safety:

1. **Nullable Type Declaration:** When declaring a variable, you can explicitly mark it as nullable by appending `?` after its type. For example:

dartCopy code

2. **Null-aware Access:** The `?.` operator is used for null-aware access, which allows accessing properties or calling methods on an object only if the object is not null. If the object is null, the expression evaluates to null. For example:

dartCopy code

3. **Null-aware Assignment:** The `??=` operator is used for null-aware assignment, which assigns a value to a variable only if the variable is currently null. For example:

dartCopy code

4. **Conditional Expression:** The `condition ? expr1 : expr2` operator is used for conditional expressions. In Dart null safety, both `expr1` and `expr2` can be nullable, and the result of the expression is nullable if either `expr1` or `expr2` is nullable. For example:

dartCopy code

5. **Function Invocation:** The `?` operator can be used to make function invocations null-safe. If the function might be null, you can use `?.` to invoke it conditionally. For example:

dartCopy code

**52. Create a late variable named address, assign a US value to it and print it.**

**Program and Output Screenshot:**

## Dart Programming

```

928 // 52. Create a late variable n
929 late String address;
